

CASE REPORT

Case File: 2007-02-21-CH
Location: Industrial Zone
Cork Harbour, County Cork, Ireland
Investigating Agent(s):
DI Mark Riordan
DA Jennifer Murphy

ACCEPTED

CONFIDENTIAL

EXECUTIVE SUMMARY:

This report details the preliminary findings of a DAPUE investigation initiated following anomalous activity detected within a derelict industrial complex in Cork Harbour. The investigation uncovered a clandestine operation involving the unlawful confinement and exploitation of multiple individuals identified as belonging to the anomalous population known [REDACTED]. These individuals were being held against their will, their [REDACTED] - integral to their ability to [REDACTED] - having been confiscated. A local individual, [REDACTED], has been apprehended in connection with this operation. The rescued [REDACTED] are currently in DAPUE custody, and their well-being is the priority.

Incident Details:

Location: Derelict Warehouse Complex,
Cork Harbour,
County Cork,
Ireland.

Date of Incident: Initial activity
was reported on February 20th, 2007.
Covert entry and apprehension took
place on February 21st, 2007.

Individuals Involved:

Victims: Multiple individuals identified as [REDACTED]. Specific numbers are being withheld pending further interviews and processing.

Suspect: [REDACTED], local
[REDACTED].

(a) [REDACTED] - M42

[REDACTED], identified as the primary individual of interest in Incident Report 2007-02-21-CH, is a male subject with an estimated age range of 45-55 years. His physical appearance is consistent with an individual engaged in [REDACTED] within the Cork Harbour region. Observable characteristics include pronounced rhytides across the face, indicative of prolonged exposure to [REDACTED]. He exhibits a persistent growth of facial

hair, described as unkempt and lacking deliberate styling. Subject [REDACTED] general demeanor, based on surveillance and initial interaction during apprehension, suggests a pragmatic and potentially opportunistic disposition. Further psychological profiling is pending. His professional background reportedly involves independent operation of small watercraft for various purposes within the harbour, providing a potential means for both accessing the location of the anomalous [REDACTED] and facilitating their exploitation. A comprehensive background investigation into Subject [REDACTED] activities and associates is currently underway.

Findings

The confined [REDACTED] exhibited physiological traits consistent with [REDACTED] descriptions, including a [REDACTED] to their [REDACTED], an aversion to prolonged [REDACTED], and a palpable distress when denied access to the [REDACTED]. Examination of the warehouse yielded several [REDACTED], each displaying unique, almost [REDACTED]. These were stored within a reinforced, climate-controlled container.

Post-operations interviews with [REDACTED] provided fragmented accounts of their capture. Their narratives consistently pointed towards a local [REDACTED], identified as one [REDACTED], luring [REDACTED] with promises of trade before [REDACTED].

A [REDACTED] possess the anomalous ability to [REDACTED], a process seemingly dependent on the possession of a unique [REDACTED]. Exercise extreme caution during any field operations or direct interactions.

Anomalous Properties:

Preliminary analysis of the recovered [REDACTED], designated provisionally as [REDACTED] indicates a complex [REDACTED] interwoven with an as-yet-unidentified [REDACTED]. This composite structure appears integral to the [REDACTED] process associated with the [REDACTED]. Notably, these artifacts exhibit a faint [REDACTED] under environmental conditions correlating with specific [REDACTED] observed within Cork Harbour. The artifacts are currently secured within a Level 3 anomalous materials vault at DAPAUE regional headquarters, pending comprehensive research into their [REDACTED], and potential for safe return to their respective owners.

Environmental assessment of the confinement area within the derelict warehouse revealed elevated concentrations of stress hormones, likely originating from the [REDACTED]. Trace amounts of [REDACTED] were also detected, suggesting attempts by the [REDACTED] to alleviate physiological distress associated with prolonged separation from [REDACTED]. These environmental findings corroborate testimonial evidence indicating a fundamental [REDACTED] dependence on [REDACTED] for the [REDACTED].

Please refer to case file 2007-02-20-CH for further information pertaining to the [REDACTED] exploitation of the [REDACTED].
